Minor Changes Made from Design Freeze Documentation

- As discussed when reviewing the design freeze documentation, a hole was added on the bottom for the back facing camera.

- Forgot to add a lightning connector plug, showing how the ipad connects to the button module once placed inside the rubber case.

- The layout of buttons on the iPad was in the opposite direction of the way it should be (eg. the iPad's volume buttons would've been where the hinge/kickstand is), so the design was flipped, having the iPad placed into the device leftwards, and the module with buttons is on the right. Flipping the design didn't change anything else about how the device would function.
